

Quick setup sheet

Adding Products That Are Sold by Weight

Some things in the shop are sold **by the kilogram** — meat, fish, chicken, liver. These are called **weighed products**. Before the till can ring one up, two people / two places must be set up **to match**:

1. ON THE SCALE

Each product gets a number — a **PLU**. The scale knows its name & price per kg.

2. IN THE POS

You add the product and type that **same PLU number** in the "Scale PLU" box.

3. AT THE TILL

The clerk scans the printed sticker — the item rings up at the right price.

The one rule that matters

The **PLU number** and the **price per kg** must be **exactly the same** on the scale and in the POS. If the scale says PLU 2 = Beef Sausages at K85/kg, then in the POS, Beef Sausages must have Scale PLU 2 and Selling Price 85. This sheet is about step 2 — keying them into the POS.

● A worked example

Say the butcher programs the scale like this: **PLU 2 = Beef Sausages, K85.00 per kg**. You then add the same product in the POS, set its price to 85 per kg, tick "Sold by weight," and put 2 in **Scale PLU**.

Now when a customer buys some, the butcher weighs 0.620 kg and the scale prints a barcode sticker. The clerk scans it and the till shows:

Beef Sausages (0.620 kg) = K 52.70

$0.620 \text{ kg} \times \text{K}85.00 = \text{K}52.70$. The clerk types nothing — scanning the sticker does it all. This works even if the internet is down.

You only do this setup **once per product**. After that, it just works at every till.

● How to key a weighed product into the POS

Do this on a **laptop or phone** using the admin website — it's easier to type on, and it sends the product to all three tills automatically within about half a minute.

- 1 Open the admin site and sign in, then tap **Products**.
- 2 Tap **" + Add Product "** (top right). To fix an existing one, tap the **pencil** next to it instead.
- 3 Fill in the **Product Name**, choose the **Category**, and set the **Selling Price** to the **price per kilogram** (the same price that is on the scale).
- 4 Tick the box **"Sold by weight (butchery)"**. A new box called **"Scale PLU"** appears underneath.
- 5 In **Scale PLU**, type the **same number** the product has on the scale (for example **2**).
- 6 Tap **"Add Product"** (or **"Update Product"**) to save. Done.

The screenshot shows the 'Add New Product' form in the Ariemmas POS admin interface. The form is titled 'Add New Product' and has a subtitle 'Add a new item to your inventory'. It contains several input fields: 'Product Name' (filled with 'Beef Sausages'), 'Barcode' (with a 'Scan, type, or generate' button), 'Category' (a dropdown menu set to 'Groceries'), 'Selling Price (K)' (filled with '85'), 'Cost Price (K)' (filled with '0.00'), 'Stock Qty' (filled with '0'), 'Min Stock Alert' (filled with '5'), 'VAT Rate' (a dropdown menu set to 'Standard (16%)'), 'Unit' (a dropdown menu set to 'Kilogram'), and a checkbox labeled 'Sold by weight (butchery)' which is checked. Below these fields is a section titled 'Scale PLU (Label-Printing Scale)' with a text input field containing the number '2'. At the bottom of the form are 'Cancel' and 'Add Product' buttons. The background shows a blurred view of the main product list with columns for 'PRODUCT', 'BARCODE', and 'STATUS'.

What it looks like. Selling Price is the price per kg, "Sold by weight (butchery)" is ticked, and **Scale PLU** holds the product's number from the scale.

● What each box means

Product Name What the customer sees on the screen and receipt (e.g. *Beef Sausages*).

Selling Price The price for **one kilogram**. Must match the scale.

Sold by weight Tick this for anything weighed. It turns the unit into **kg**.

Scale PLU The product's number on the scale. Must match the scale.

● Your weighed-products worksheet

Write down every weighed product here as you set it up. Fill the PLU and price per kg, then tick the box once it's done on the scale and once it's done in the POS. The first two rows are filled in as examples.

PLU #	PRODUCT NAME	PRICE / KG (K)	ON SCALE	IN POS
1	T-Bone Steak	289.99	✓	✓
2	Beef Sausages	85.00	✓	✓
			☐	☐
			☐	☐
			☐	☐
			☐	☐
			☐	☐
			☐	☐

● Check it worked & common mistakes

Test each product once

Print a sticker from the scale and scan it at a till. It should show the right name, weight and price. If the till says **"Scale item PLU X isn't linked to a product yet,"** the number doesn't match — check the PLU on the scale and in the POS are the same.

Watch out for these

- **Different PLU** on the scale vs the POS — they must be identical.
- **Different price per kg** — the sticker charges the scale's price, so make them match.
- Forgot to tick **"Sold by weight"** — then the Scale PLU box never appears.
- Typing the price as **grams** or a total — it must be the price for **one kilogram**.

Keep this sheet near the scale. When you add a new weighed product, do the scale and the POS at the same time so the numbers always match.
