

Setup sheet — weighed products

Setting Up Products Sold by Weight

Meat, fish, chicken — anything sold **by the kilo**. Each one needs **two steps**, and the numbers must **match**:

PART A · THE SCALE

Give the product a number — a **PLU** — with its name & price per kg.

PART B · THE POS

Add the product and type that **same PLU** in “Scale PLU”.

THEN · THE TILL

Clerk scans the printed sticker — it rings up on its own.

The one rule

The **PLU number** and the **price per kg** must be the **same** on the scale (Part A) and in the POS (Part B). Do **both parts** for every weighed product.

Example — Beef Sausages, PLU 2, K85/kg

Set it on the scale as PLU 2 at K85/kg, then add it in the POS with Scale PLU 2 and price 85. A customer buys 0.620 kg → the sticker scans as **Beef Sausages (0.620 kg) = K52.70**. Works offline too.

Start your real products at PLU 2

PLU 1 is still the “TEST” item from setup. Either leave it, or reprogram it to a real product using Part A. Give each real product its own number — 2, 3, 4 ...

Program the product on the scale

Do this on the scale. **It beeps on every key press — that's normal.** First press

Cancel / **Mode** until the screen shows **0.000 kg**. Then follow these keys (example: **PLU 2 = Beef Sausages, K85.00/kg**):

PRESS	SCREEN SHOWS	WHAT IT MEANS
Prog then 2 then 3	F23 PLU.00 noSEt 0	You're in PLU edit.
2 (the PLU number)	... noSEt 2	This product = PLU 2.
V4 →	F23 PLU.01 iCodE	Item-code step.
2	... 2	Item code (use the same number).
V4 →	F23 PLU.03 Unit 0	Leave at 0 = sold by weight.
V4 →	F23 PLU.04 PriCE	Price step.
8 5 0 0	... 85.00	Price per kg. Last 2 digits are cents.
V4 →	F23 PLU.14 nAmE	Name step.
Accu/Confirm	En-1 0	Now in text-typing mode.
Type the name on the letter keys (each key has 2 letters; press IME to switch to CAPITALS).	B E E F ...	e.g. BEEF SAUS.
Amend	(saves the name)	Saves the name.
V4 → then 0	F23 PLU.26 ... 0	0 = don't print a shelf date.
Amend	F23 PLU.00 noSEt 0	PLU saved! Back at the start.

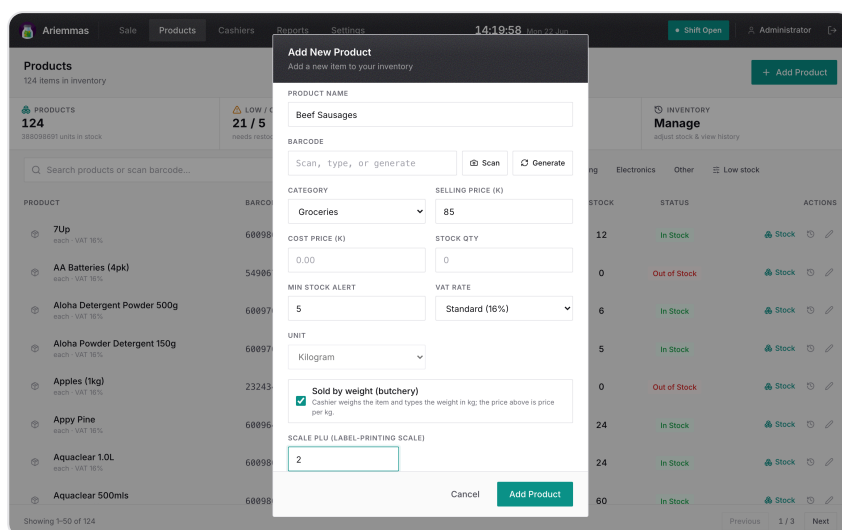

Save, then next or finish

The final **Amend** saves the product — **skip it and nothing is saved.** To add another, type its PLU number and repeat. When done, press **Cancel** / **Mode** to **0.000 kg** (or switch off — saved PLUs stay). Write each PLU on the worksheet as you go.

Add the same product in the POS

Do it on a **laptop or phone** (admin website). It syncs to all three tills. Use the **same PLU and price** as on the scale.

- 1 Open **Products** → tap **" + Add Product "** (or the **pencil** to edit one).
- 2 Enter the **Name**, pick the **Category**, set **Selling Price** = price per kg (same as the scale).
- 3 Tick **"Sold by weight (butchery)"**. The **Scale PLU** box appears.
- 4 Type the **Scale PLU** — the same number you gave it on the scale.
- 5 Tap **Save**.

What it looks like. Price per kg, "Sold by weight" ticked, and the **Scale PLU** number (here 2) filled in.

Name What shows on the screen & receipt.

Selling Price Price for **one kg**. Match the scale.

Sold by weight Tick for anything weighed.

Scale PLU The product's number on the scale. Match the scale.

● Worksheet

Write each weighed product here as you set it up. Tick when it's done on the scale and in the POS. (First row is an example.)

PLU #	PRODUCT NAME	PRICE / KG (K)	ON SCALE	IN POS
2	Beef Sausages	85.00	✓	✓
			☐	☐
			☐	☐
			☐	☐
			☐	☐
			☐	☐
			☐	☐
			☐	☐
			☐	☐
			☐	☐
			☐	☐

● Check & common mistakes

Test each product

Print a sticker from the scale and scan it at a till. It should show the right name, weight and price. If the till says **"PLU X isn't linked,"** the numbers don't match.

Common mistakes

- PLU different on the scale vs the POS — must be identical.
- Price per kg different on the scale vs the POS.
- Forgot **Amend** on the scale, so the product didn't save.
- Forgot to tick **"Sold by weight"** in the POS.
- Used PLU 1 for a real product — it's the TEST item.
